

# Where Heat Meets Cold

The most advanced non-invasive  
cryolipo treatment.

# THE PROCESS

## 60 minutes

Lipocontrast is a NEW body contouring treatment, based on advanced Cryothermal technology. Lipocontrast delivers rapid results by heating, cooling and heating the fat cells, reducing body fat without damage or invasive methods. 33% of the treated fat tissue will be eliminated and gradually breaks down through the metabolic system. Approximately 80% of the final result will be visible within 20 days. Typical daily activities can be resumed straight after treatment, including returning to work and exercise regimens.

Lipocontrast is  
one step beyond  
normal fat  
freezing

## Lipocontrast process

1. Before Session

2. Initial heating

3. Cooling

4. Final heating

5. After session

# THE PROCESS

The treatment area is cleansed and a conductive gel is applied to the area, the head of the machine is then placed on the treatment area, the client may feel an uncomfortable sensation immediately which will ease within a few minutes and treatment will cause minimum discomfort thereafter.

Lipocontrast can target large and small areas such as the flanks, upper and lower abdomen, back, thighs, knees, gynaecomastia, arms and the double chin through multi-sized applicators. Other areas available upon request.

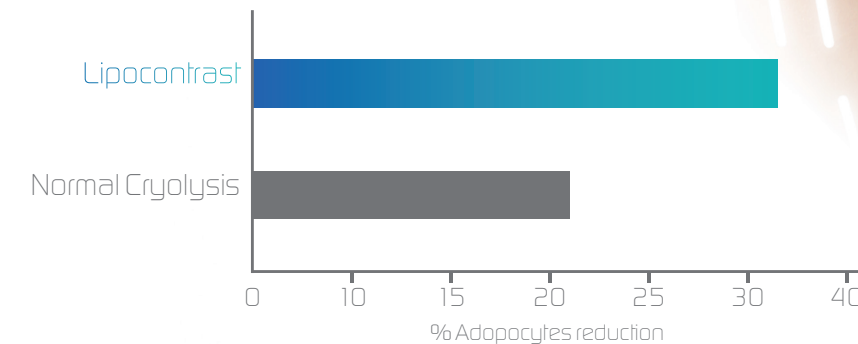

- After treatment with the Lipocontrast thermal shock, some fat cells are immediately disabled and will be eliminated within a few days.
- Other cells enter in to severe apoptosis phase and will be progressively eliminated within a few weeks.

# THE ADVANTAGES

The new LIPOCONTRAST procedure benefits are:

- Faster and superior fat reduction compared with normal cryolysis procedures.
- Increased effectiveness on fibrous fat.
- Avoids traumatic experiences of invasive methods such as liposuction.
- Prevents contiguous tissue damage that occurs with radio-frequency, ultrasounds or lasers.

## 80% of results are visible within two weeks.

# THE RESULTS

The effect produced is almost immediate. After treatment with the Lipocontrast thermal shock, some fat cells are immediately disabled and will be eliminated within a few days. Other cells enter in severe apoptosis phase and will be progressively eliminated within a few weeks.

Depending on the adipose tissue thickness and the desired result, 1 to 3 sessions will be necessary, with an approximate interval of 4 weeks between each one – much shorter than cryo-lipo alternatives, giving quicker results. The duration of each session is 60 minutes

“ I lost 1.7 inches on my lower abdominals, with no dieting and no weight loss. I have had one session and now I am looking forward to my second session to see more results.

Amanda Blamey

“ My double chin was always an area of dislike, no matter how much weight I lost, my double chin still remained. I was thrilled when hearing about Lipocontrast and I am even more thrilled with my results. I would highly recommend this treatment as its pain free & non-invasive.

Joel Masters

I had my first session of Lipocontrast and I loved it! It hurt a lot less than I imagined (it didn't actually hurt at all), it was nice to be able to lie down and relax. An all-round enjoyable experience, that will get rid of my post pregnancy baby bump ! I Can't wait for my next session.
